Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                 GenEmbl:*

Composition containing lipid-encapsulated therapeutic agent useful, e.g. for delivering antisense molecules or ribozymes or treating diseases associated with aberrant gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the nucleotide sequence of the human antisense c-raf-1 oligodeoxyribonucleotide (ODN/oligo), used in the method of the invention to directly target tumour tissue, and in cancer radiation therapy. The products can be used in a method of radiosensitising tumour tissue by addition of an antisense oligonucleotide of maximum 40 bases containing ODN/oligo. The liposome carrier system directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New cationic liposome composition containing raf oligodeoxynucleotide - can be used to directly target tumour tissue and is useful in the radiation therapy of cancers

The present sequence represents an antisense oligonucleotide directed consideration to the human c-raf-1 protein kinase gene. The oligonucleotide can against the human c-raf-1 protein kinase gene. The oligonucleotide can comprising lipid-encapsulated using the method of the invention. A composition comprising lipid-encapsulated particles of a therapeutic agent, comprising lipid-encapsulated particles of a therapeutic agent of the unixture of oligonucleotides, is prepared by mixing at least 2 lipids continuous solution of charged therapeutic agent to form an intermediate mixture to neutralise at least some of the external surface contarges on the particles. One lipid has a (de)protonatable group with contarges on the particles. One lipid has a (de)protonatable group with contarges on the particles of the intermediate mixture to neutralise at least some of the external surface contarges on the particles. One lipid has a (de)protonatable group with contarges on the particles one lipid has a (de)protonatable group with the particles of the particles of the particles of the buffer maintains this contarged form (i.e. cationic when the therapeutic agent is contarged form (i.e. cationic when the therapeutic agent particle agent particles of the composition is used to introduce therapeutic agent particles. The composition is used to introduce therapeutic agent particles. The composition is used to introduce therapeutic agent particles. The composition is used to introduce therapeutic agent particles in vivo or in vitro, particularly to treat or prevent diseases associated with aberrant gene expression in mammals, specifically tumours, so inflammation or infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents an antisense oligonucleotide sequence which has human c-raf-1 protein kinase as its target gene. The oligonucleotide is used in a method for delivering lipid encapsulated therapeutic agents (i.e antisense oligonucleotides) to mammals. The lipid capsule comprises steric barrier lipids that prevent particle aggregation during lipid nucleic acid formation. The method may be used for the delivery of therapeutic agents to mammalian cells. It is especially suitable for delivering nucleic acid molecules, and in particular antisense molecules which may be administered to down regulate the expression of aberrant genes. The aberrant gene may be ICAM-1, c-myc, c-myb, ras, raf, erb-B-2, PKC-alpha, IGF-IR, EGFR, VEGF and/or VEG-R-1. The method may be used for the treatment of tumours, inflammatory diseases and/or infectious

CC lipid component selected from lipids containing a protonatable or that the lipid is in charged form at a first pH and in neutral form at component is further selected from lipids containing a protonatable or that the lipid is in charged form at a first pH and in neutral form at camponent is further selected such that the charged form is cationic component is selected from lipids that prevent particle aggregation countries lipid enterapeutic agent particles formation and which exchange cout the lipid particle at a rate greater than PEG-Cerc20; third lipid component is a neutral lipid selected from distearoylphosphatidylcholine (DSPC), palmitoyloleoyl phophatidylcholine (POPC), 1,2-dioleoyl-sn-3-cc phosphoethanolamine (DOPE) or SM (Sphingomyelln) and a fourth lipid component which is cholesterol. Compositions of the invention are used component which is cholesterol. Compositions of the invention are used conformed preferably ICAM-1 (Intracellular adhesion molecule-1), c-myc, c-myc, raf, erb-B-2, PKC-alpha (phosphothanase C-alpha), IGF-IR cc (insulin growth factor 1-receptor), bc1-2, EGFR (epidermal growth factor creceptor), in a mammal or by inflammations such as tumour or an cc infectious disease. The present sequence is an antisense oligonucleotide cargetted to human c-raf-1 protein kinase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a composition useful for treatment tumours. The composition comprises lipid-therapeutic agent propositing a lipid portion and a charged therapeutic agent encapsulated in the lipid portion. The lipid portion comprise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition useful for treatment of e.g. tumors comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       lipid portion and a charged therapeutic

The invention provides antisense oligonucleotides targeted to mRNV encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing abnormal proliferative states and hyperproliferation (e.g. cancer, psoriasis, or blood vessel restenosis), and inhibiting raf express sequences Z115511-564 represent antisense oligonucleotides for mou

They can be used for the inhibition of raf expression. The oligonucleotides (ONS) are targeted to either coding region, start signal or 5′ or 3′ untranslated region (UTR) mRNA encoding mouse/rat c-raf. The ONs are phosphorothicate linked. The ONS are used to inhibit expression of rat and mouse raf. The ONS can be used in partic. In conditions associated with hyperproliferation e.g.

                                                    c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation control. The present sequence is an antisense oligonucleotide. This sequence is targeted to mouse and rat c-raf genes, resulting in c-raf expression inhibition. The present sequence may be useful for treating and raf-rassociated cell hyperproliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, anglogenesis, psoriasis, atherosclerosis and smooth muscle cell proliferation in blood vessels e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tiss graft rejection, endotoxin shock and glomerular nephritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotides targeted to nucleic acid molecule encoding human raf useful for diagnosis, treatment of raf-associated cell proliferative conditions such as cancer, psoriasis or blood vessel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        signal transduction; hyperplasia; pulmonary fibrosis; anglogenesis; psorlasis; atherosclerosis; smooth muscle cell proliferation; steno restenosis; inflammatory disorder; tissue graft rejection; endotoxin shock; glomerular nephritis; mouse; rat; ss.

                                                                                  CC apable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic comprises: (a) introducing into the system a random library of nucleic comprises: (a) introducing into the system a random library of nucleic caid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC can systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules cof at least part of the SBDs in such systems. Nucleic acid molecules cof at least part of the SBDs in such systems. Nucleic acid molecules cof at least part of the SBDs in such systems. Nucleic acid molecules call invention, are used to modulate gene expression in plant and mammalian call invention, are used to modulate gene expression. They may also be used to calls and to cleave target nucleic acid, particularly for treating composition in composition in fection. They may also be used to detect genetic drift and mutations in diseased cells and to determine composition of the Raf gene, are used to treat cancer, restemosis, composition of the Raf gene, are used to treat cancer, restemosis, composition of the real cancer of sugaryphosphate modifications concreases stability against nuclease and activity. AAV90922 to AAV93877 composition according the method, specifically for meaning the second concerns that can be used in the method, specifically for meaning the second concerns and call the method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Beaudry A,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Best Local
                                                                                                                                                                                                                                      AAT27481-T27507 are human c-raf kinase antisense oligonucleotides use for the inhibition of raf expression. The oligonucleotides (ONs) are targeted to either coding region, start or stop signal or 5' or 3' untranslated region (UTR) mRNA encoding human c-raf. The ONs may be phosphorothioate linked and may contain modifications at the 2' position of the sugar moiety, ONs are pref. complementary to either 3' or 5' UTRs, phosphorothioate linked and contain 2'-O-alkyl sugar modifications. The ONs are used to inhibit expression of human raf in partic. in conditions associated with hyperproliferation e.g.

The present sequence represents a specifically claimed oligonucleotide for use in the composition. The composition can be used to treat mammalian cancer, especially human lung, stomach, renal, breast, laryngeal, pancreatic or colorectal cancer, or malignant melanoma. The anionic polysaccharide increases tumour uptake of the oligonucleotide, particularly an oligonucleotide targeted to human raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cancer; anionic polysaccharide; human; renal cancer; breast cancer; laryngeal colorectal cancer; malignant melanoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      laryngeal, pancreatic, colorectal cancer and malignant melanoma. In particular the compsns. can inhibit abnormal raf expression and retain anti-hyperproliferative activity after prolonged circulation in the bloodstream. They facilitate the reduction of accumulation of ONs in non-target organs and a reduction of acute and chronic side effects during prolonged treatment. ONI-10 are oligodeoxynucleotides with phosphorothicate backbones designed using the Genbank c-raf sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              stabilised liposomes are claimed. The compsns. can be used for inhibiting the expression of human raf. They can be used for the treatment of mammalian cancer, partic. human cancer e.g. lung, stomach, renal, breast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 T59716-28 are preferred oligonucleotides which are targeted to mRNA encoding human raf and are capable of inhibiting raf expression. Compositions containing the oligonucleotides entrapped in sterically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       19-SEP-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides antisense oligonucleotides targeted to mRNA encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing abnormal proliferative states and hyperproliferation (e.g. cancer, psoriasis, or blood vessel restenosis), and inhibiting raf expression. Sequences AAXIISIL-573 and AAXIISIS-573 represent antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation control. The present sequence is an antisense oligonucleotide. This sequence is targeted to human c-raf gene, resulting in c-raf expression inhibition. The present sequence may be useful for treating and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue graft rejection, endotoxin shock and glomerular nephritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 31; Column 9; 31pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          can be used to detect genomic amplifications in the 20q13 (especially the 20q13.2) amplicon, which is associated and indicative of the presence of a large number of cancers, e.g. primary tumours of breast, ovary, bladder, head and neck and colon cancers. The method uses the technique of comparative genome hybridisation (CGH) which is able to reveal amplifications and deletions in genomic chromosomes irrespective of genome rearrangements. However CGH also provides a more quantitative estimate of copy number than, e.g. Southern hybridisation, and also provides the localisation of the amplified or deleted region in a normal chromosome. Fluorescent in situ hybridisation was further performed using locus specific probes to confirm the CGH data and to precisely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method has been developed for detecting chromosomal abnormalities at about position Fipter 0.825 on the human chromosome 20. The method comprises: (i) contacting a chromosomal sample from a patient with at least 1 labelled probe, which binds to a target sequence at about position Fipter 0.825 on the human chromosome 20; and (ii) detecting the binding of the probes to the target sequence. AAX16548 to AAX16586 represent nucleic acid sequences to which the probes can hybridise. These nucleic acid sequences also represent PCR primers. The probes and method are the probes of the probes and method are the probes and method are the probes are present purposed to the probes and method are the probes are present probes.
                                                                                                                                                                                                                                                                                                                                                                                              Human chromosome 20; position FLpter 0.825; chromosome abnormality; PCR primer; probe; hybridisation; detection; breast cancer; tumour; ovary; bladder; head; neck; colon; comparative genome hybridisation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detection of abnormalities on human chromosome 20 at position 20q13 - is useful as indicator of presence of, e.g. primary breast tumours

```
represent nucleic acid sequences to which the probes can hybridise. These nucleic acid sequences also represent PCR primers. The probes and method can be used to detect genomic amplifications in the 20q13 (especially the 20q13.2) amplicon, which is associated and indicative of the presence of a large number of cancers, e.g. primary tumours of breast, ovary, bladder, head and neck and colon cancers. The method uses the technique of comparative genome hybridisation (CGH) which is able to reveal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A method has been developed for detecting chromosomal abnormalities at about position FLpter 0.825 on the human chromosome 20. The method comprises: (i) contacting a chromosomal sample from a patient with at least 1 labelled probe, which binds to a target sequence at about position FLpter 0.825 on the human chromosome 20; and (ii) detecting the binding of the probes to the target sequence. AAXI6549 to AAXI6586
                                                     chromosome. Fluorescent in situ hybridisation was further performed using locus specific probes to confirm the CGH data and to precisel map the region of the amplification.
                                                                                                                                          amplifications and deletions in genomic chromosomes irrespective of genome rearrangements. However CGH also provides a more quantitative estimate of copy number than, e.g. Southern hybridisation, and also provides the localisation of the amplified or deleted region in a normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 2; Page 14; 40pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleic search, using sw model

                                                                  The invention provides antisense oligonucleotides targeted to mRNA encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing abnormal proliferative states and hyperproliferation (e.g. cancer, psoriasis, or blood vessel restensis), and inhibiting raf expression. Sequences Z115511-564 represent antisense oligonucleotides for mouse a

They can be used for the inhibition of raf expression. The oligonucleotides (ONS) are targeted to either coding region, start signal or 5' or 3' untranslated region (UTR) mRNA encoding mouse/rat c-raf. The ONs are phosphorothicate linked. The ONs are used to inhibit expression of rat and mouse raf. The ONs can be used in partic, in conditions associated with hyperproliferation e.g.

                                                                                                                      control. The present sequence is an antisense oligonucleotide. This sequence is targeted to mouse and rat c-raf genes, resulting in c-raf expression inhibition. The present sequence may be useful for treating and raf-associated cell hyperproliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, atherosclerosis and smooth muscle cell proliferation in blood vessels e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue
                                                                                                                                                                                                                                                                                               Antisense oligonucleotides targeted to nucleic acid molecule human raf useful for diagnosis, treatment of raf-associated comproliferative conditions such as cancer, psoriasis or blood versions.
                                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         psoriasis; atherosclerosis; smooth muscle cell prolife restenosis; inflammatory disorder; tissue graft reject endotoxin shock; glomerular nephritis; mouse; rat; ss.
                                                                                    Sequence
                                                                                                                                                                                                                          c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation

                                                                                                                                                            AAT27481-T27507 are human c-raf kinase antisense oligonucleotides used for the inhibition of raf expression. The oligonucleotides (ONS) are targeted to either coding region, start or stop signal or 5′ or 3′ untranslated region (UTR) mRNA encoding human c-raf. The ONS may be phosphorothioate linked and may contain modifications at the 2′ position of the sugar moiety. ONS are pref. complementary to either 3′ or 5′ UTRs, phosphorothioate linked and contain 2′-07-alkyl sugar modifications. The ONS are used to inhibit expression of human raf in partic. In conditions associated with hyperproliferation e.g.

AAT86615-T86620 are oligonucleotides designed to be used in a novel method for cleaving RNA. These oligonucleotides act as artificial substrates for mammalian double stranded ribonucleases (dsRNases), in particular, c-raf. Novel ribonucleases generated by this method could be used for treating an organism having a disease characterised by the undesired production of a protein encoded by the mRNA. They can also be used for identifying an mRNA or a protein or for diagnosing an aberrant

The present sequence is a sense RNA sequence which, when hybridised with its complement, was used as a substrate for a dsRNase. This type RNase, which specifically cleaves double-stranded RNA, is used in timethods of the invention and can be used to detect the presence of abnormal RNA or abnormal expression of RNA in organisms or cells. The can also be used to modulate enzyme activity in in vitro assays. The
                                                                                                                                                                                                                                                                                                                                                                                                        C-raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides antisense oligonucleotides targeted to mRN encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing
                                                                                        Example
                                                                                                               comprising segments with specific nucleoside phosphorothicate internucleoside linkages -

                                                                                                                                                                                                                                                                                                      The present sequence is an antisense RNA sequence which, when hybridith its complement, was used as a substrate for a dsRNase. This transe, which specifically cleaves double-stranded RNA, is used in a methods of the invention and can be used to detect the presence of abnormal RNA or abnormal expression of RNA in organisms or cells. I can also be used to modulate enzyme activity in in vitro assays. The present sequence contains 2'-methoxyphosphorothicate wings on either those processing the sequence contains and the sequence contains are sequence contains and the sequence contains and the sequence contains are sequence contains and the sequenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present sequence has phosphodiester linkages in an 8 base gap with flanks having residues with phosphorothioate linkages either with or without 2^\prime-methoxynucleosides.
                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel oligomeric compounds for diagnostic and research comprising segments with specific nucleoside subunits lobosphorothicate internucleoside linkages -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         C-raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                       phosphorothioate linkages.
